Problem 1

Let M , N and P be R -modules and let F be a free R -module of rank n . Show that there are isomorphisms, which are all natural (except for the last):

(a) $M \otimes_R N \simeq N \otimes_R M$.

Proof. Let $v : N \times M \rightarrow N \otimes_R M$ be the bilinear map associated with $N \otimes_R M$. Define $f : M \times N \rightarrow N \otimes_R M$ that sends (m, n) to $v(n, m)$. By the universal property of tensor product, there is an induced module homomorphism $\phi : M \otimes_R N \rightarrow N \otimes_R M$. Similarly, there exists an induced module homomorphism $\psi : N \otimes_R M \rightarrow M \otimes_R N$. By the universal property of tensor product, $\text{Hom}(M \oplus N, M \oplus N)$ and $\text{Hom}(N \oplus M, N \oplus M)$ only contain the identities. But then $\phi \circ \psi \in \text{Hom}(M \oplus N, M \oplus N)$ and $\psi \circ \phi \in \text{Hom}(N \oplus M, N \oplus M)$, so ϕ and ψ are inverses. It follows that ϕ is a module isomorphism, so $M \otimes_R N \simeq N \otimes_R M$. \square

(b) $(M \otimes_R N) \otimes_R P \simeq M \otimes_R (N \otimes_R P)$.

Proof. For $m \in M$, define $\psi_m^B : N \times P \rightarrow (M \otimes_R N) \otimes_R P$, which sends (n, p) to $(m \otimes n) \otimes p$. Note that ψ_m^B is obviously bilinear and well-defined, and thus the universal property gives us a linear mapping $\psi_m : N \otimes_R P \rightarrow (M \otimes_R N) \otimes_R P$. We now define $\phi^B : M \times (N \otimes_R P) \rightarrow (M \otimes_R N) \otimes_R P$, which sends $(m, n \otimes p)$ to $\psi_m(n, p)$. We check that ϕ^B is bilinear. Let $m, m' \in M$, $r \in R$, and $v, v' \in N \otimes_R P$, say $v = \sum a_{ij} n_i \otimes p_j$ and $v' = \sum b_{ij} n_i \otimes p_j$. Since

$$\begin{aligned} \phi^B(m + m', v) &= \psi_{m+m'}(v) \\ &= \sum a_{ij} \psi_{m+m'}(n_i \otimes p_j) \\ &= \sum a_{ij} ((m + m') \otimes n_i) \otimes p_j \\ &= \sum a_{ij} \psi_m(n_i \otimes p_j) + \sum a_{ij} \psi_{m'}(n_i \otimes p_j) \\ &= \psi_m(v) + \psi_{m'}(v) = \phi^B(m, v) + \phi^B(m', v), \end{aligned}$$

$$\begin{aligned} \phi^B(m, v + v') &= \psi_m(v + v') \\ &= \sum (a_{ij} + b_{ij}) \psi_m(n_i \otimes p_j) \\ &= \sum a_{ij} (m \otimes n_i) \otimes p_j + \sum b_{ij} (m \otimes n_i) \otimes p_j \\ &= \sum a_{ij} \psi_m(n_i \otimes p_j) + \sum b_{ij} \psi_m(n_i \otimes p_j) \\ &= \psi_m(v) + \psi_m(v') = \phi^B(m, v) + \phi^B(m, v'), \end{aligned}$$

$$\begin{aligned} \phi^B(rm, v) &= \psi_{rm}(v) \\ &= \sum a_{ij} \psi_{rm}(n_i \otimes p_j) \\ &= r \sum a_{ij} \psi_m(n_i \otimes p_j) \\ &= r \psi_m(v) = r \phi^B(m, v), \end{aligned}$$

$$\phi^B(m, rv) = \psi_m(rv) = r \psi_m(v) = r \phi^B(m, v),$$

ϕ^B is indeed bilinear, so we obtain a linear $\phi : M \otimes_R (N \otimes_R P) \rightarrow (M \otimes_R N) \otimes_R P$, by the universal property. We may repeat the above process to obtain an induced linear map $\varphi : (M \otimes_R N) \otimes_R P \rightarrow M \otimes_R (N \otimes_R P)$, and thus ϕ and φ are inverses of each other, by the standard uniqueness argument. The result now follows. \square

(c) $R \otimes_R M \simeq M$.

Proof. Define mapping $f : R \times M \rightarrow M$ that sends (r, m) to rm . Note that f is obviously bilinear. The universal property of tensor product gives us a R -linear mapping $\phi : R \otimes_R M \rightarrow M$ which sends $r \otimes m$ to $f(r, m)$, that is, rm . Since for all $m \in M$, we have $1 \otimes m \in R \otimes_R M$ that is mapped to m via ϕ , so ϕ is surjective. Suppose $r \otimes m$ is in the kernel of ϕ . Then $\phi(r \otimes m) = rm = 0$, so $r = 0$ or $m = 0$. But then $r \otimes m = 0$ in either case, and thus the kernel of ϕ is trivial. The result now follows from the first isomorphism theorem. \square

(d) $M \otimes_R (N \oplus P) \simeq (M \otimes_R N) \oplus (M \otimes_R P)$.

Proof. Define mapping $f : M \times (N \oplus P) \rightarrow (M \otimes_R N) \oplus (M \otimes_R P)$, which maps $(m, (n \oplus p))$ to $(m \otimes n, m \otimes p)$. This map is obviously well defined. We show that f is bilinear. Suppose $m, m' \in M, n, n' \in N, p, p' \in P$, and $r \in R$. We then have

$$\begin{aligned} f(m + m', (n, p)) &= ((m + m') \otimes n, (m + m') \otimes p) \\ &= (m \otimes n, m \otimes p) + (m' \otimes n, m' \otimes p) \\ &= f(m, (n, p)) + f(m', (n, p)), \end{aligned}$$

$$\begin{aligned} f(m, (n, p) + (n', p')) &= (m \otimes (n + n'), m \otimes (p + p')) \\ &= (m \otimes n, m \otimes p) + (m \otimes n', m \otimes p') \\ &= f(m, (n, p)) + f(m, (n', p')), \end{aligned}$$

$$\begin{aligned} f(rm, (n, p)) &= (rm \otimes n, rm \otimes p) \\ &= (r(m \otimes n), r(m \otimes p)) \\ &= r(m \otimes n, m \otimes p) = rf(m, (n, p)), \end{aligned}$$

$$\begin{aligned} f(m, r(n, p)) &= (m \otimes rn, m \otimes rp) \\ &= (r(m \otimes n), r(m \otimes p)) \\ &= r(m \otimes n, m \otimes p) = rf(m, (n, p)), \end{aligned}$$

and thus f is bilinear. The universal property of tensor product now gives us an induced R -linear mapping

$$\phi : M \otimes_R (N \oplus P) \rightarrow (M \otimes_R N) \oplus (M \otimes_R P),$$

which maps $m \otimes (n, p)$ to $f(m, (n, p))$.

It remains to find the inverse of ϕ . Define $\psi_1^B : M \times N \rightarrow M \otimes_R (N \oplus P)$ by sending (m, n) to $m \otimes (n, 0)$, and define $\psi_2^B : M \times P \rightarrow M \otimes_R (N \oplus P)$ by sending (m, p) to $m \otimes (0, p)$. Note that both ψ_1^B and ψ_2^B are bilinear, so the universal property gives us linear mappings $\psi_1 : M \otimes_R N \rightarrow M \otimes_R (N \oplus P)$ and

$\psi_2 : M \otimes_R P \rightarrow M \otimes_R (N \oplus P)$. Now define $\psi : (M \otimes_R N) \oplus (M \otimes_R P) \rightarrow M \otimes_R (N \oplus P)$ by sending $((m \otimes n), (m' \otimes p))$ to $\psi_1(m \otimes n) + \psi_2(m' \otimes p)$. Note that ψ is linear, as both ψ_1 and ψ_2 are linear.

We now show that ϕ and ψ are inverses of each other. Suppose $v \in M \otimes_R N$, $w \in M \otimes_R P$, and $x \in M \otimes_R (N \oplus P)$, say $v = \sum a_{ij} m_i \otimes n_j$, $w = \sum b_{ij} m_i \otimes p_j$, and $x = \sum c_{ijk} m_i \otimes (n_j, p_k)$. Since both ϕ and ψ are linear,

$$\begin{aligned} \phi \circ \psi(v, w) &= \phi(\psi_1(v) + \psi_2(w)) \\ &= \phi(\psi_1(v)) + \phi(\psi_2(w)) \\ &= \sum a_{ij} \phi(\psi_1(m_i \otimes n_j)) + \sum b_{ij} \phi(\psi_1(m_i \otimes p_j)) \\ &= \sum a_{ij} \phi(m_i \otimes (n_j, 0)) + \sum b_{ij} \phi(m_i \otimes (0, p_j)) \\ &= \sum a_{ij} (m_i \otimes n_j, 0) + \sum b_{ij} (0, m_i \otimes p_j) = (v, 0) + (0, w) = (v, w), \end{aligned}$$

$$\begin{aligned} \psi \circ \phi(x) &= \psi \left(\sum c_{ijk} \phi(m_i \otimes (n_j, p_k)) \right) \\ &= \sum c_{ijk} \psi(m_i \otimes n_j, m_i \otimes p_k) \\ &= \sum c_{ijk} (\psi_1(m_i \otimes n_j) + \psi_2(m_i \otimes p_k)) \\ &= \sum c_{ijk} (m_i \otimes (n_j, 0) + (m_i \otimes (0, p_k))) \\ &= \sum c_{ijk} (m_i \otimes (n_j, p_k)) = x, \end{aligned}$$

and the result follows. \square

(e) $F \otimes_R M \simeq M^n$.

Proof. Note that $F \simeq R^n$. We show that $R^n \otimes_R M \simeq M^n$ by induction on n . The base case follows from (c). Suppose $n > 1$. By (d), we have $R^n \otimes_R M \simeq (R \otimes_R M) \oplus (R^{n-1} \otimes_R M) \simeq M \oplus (R^{n-1} \otimes_R M)$. The result now follows from induction. \square

Problem 2

Let m and n be integers. Identify $\mathbb{Z}_m \otimes_{\mathbb{Z}} \mathbb{Z}_n$.

Proof. Let $d = \gcd(m, n)$. We show that $\mathbb{Z}_m \otimes_{\mathbb{Z}} \mathbb{Z}_n \simeq \mathbb{Z}_d$. Let $a, b \in \mathbb{Z}$. We first note that $0 \otimes a = b \otimes 0 = 0$. In addition, since $(ab)(1 \otimes 1) = a \otimes b$, all elements in $\mathbb{Z}_m \otimes_{\mathbb{Z}} \mathbb{Z}_n$ are multiples of $1 \otimes 1$, so we have a cyclic group.

Define $f : \mathbb{Z}_m \times \mathbb{Z}_n \rightarrow \mathbb{Z}_d$ that sends (a, b) to ab . Suppose $(a, b) = (a', b')$. We know $a' = a + km$ and $b' = b + ln$, for some $k, l \in \mathbb{Z}$. But then d divides m, n , so $a' = a$ and $b' = b$, mod d . Hence, $f(a, b) = ab = a'b' = f(a', b')$, so f is well-defined. Since f is obviously bilinear, the universal property of tensor product gives us an induced module homomorphism

$$\phi : \mathbb{Z}_m \otimes_{\mathbb{Z}} \mathbb{Z}_n \rightarrow \mathbb{Z}_d,$$

which sends $1 \otimes 1$ to $f(1, 1) = 1$.

Consider $\psi : \mathbb{Z}_d \rightarrow \mathbb{Z}_m \otimes_{\mathbb{Z}} \mathbb{Z}_n$, which sends k to $k \otimes 1$. Suppose $k' = k + \alpha d$, for some $\alpha \in \mathbb{Z}$. Then,

$$\psi(k') = (k + \alpha d) \otimes 1 = k(1 \otimes 1) + \alpha(d(1 \otimes 1)).$$

Since $d = \gcd(m, n)$, $d = pm + qn$, for some $p, q \in \mathbb{Z}$. But then

$$d(1 \otimes 1) = (pm + qn)(1 \otimes 1) = p(m \otimes 1) + q(1 \otimes n) = 0,$$

so $\psi(k') = k(1 \otimes 1) = \psi(k)$, and thus ψ is well defined. Note that ψ is obviously linear.

Since $\phi \circ \psi(k) = \phi(k(1 \otimes 1)) = k$ and $\psi \circ \phi(a \otimes b) = \psi(ab) = (ab)(1 \otimes 1) = (a \otimes b)$, ϕ is an module isomorphism, and the result follows. \square

Problem 3

Show that if M and N are two finitely generated (respectively Noetherian) R -modules (respectively and R is Noetherian) then so is $M \otimes_R N$.

Proof. By Proposition 11.7., it suffices to show that $M \otimes_R N$ is finitely generated. Suppose m_1, m_2, \dots, m_k and n_1, n_2, \dots, n_l are the generators of M and N , respectively. Let $m \otimes n \in M \otimes_R N$. Since $m = \sum_i a_i m_i$ and $n = \sum_j b_j n_j$, for some $a_1, a_2, \dots, a_k, b_1, b_2, \dots, b_l \in R$, we have

$$m \otimes n = \sum_i a_i (m_i \otimes n) = \sum_i \sum_j a_i b_j (m_i \otimes n_j) = \sum_{i,j} c_{ij} (m_i \otimes n_j),$$

where $c_{ij} = a_i b_j$. Hence, $M \otimes_R N$ is generated by $m_i \otimes n_j$, for finitely many i, j , and the result now follows. \square
