Problem 1

Each of the following functions f has an isolated singularity at z=0. Determine its nature; if it is a removable singularity define f(0) so that f is analytic at z=0; if it is a pole find the singular part; if it is an essential singularity determine $f(\{z:0<|z|<\delta\})$ for arbitrarily small values of δ .

(a)
$$f(z) = \frac{\sin z}{z}$$

Proof. f has a removable singularity at z=0. Since the power series expansion of $\sin z$ is $z-\frac{z^3}{3!}+\frac{z^5}{5!}-\cdots$,

$$f(z) = 1 - \frac{z^2}{3!} + \frac{z^4}{5!} - \cdots$$

and so defining $f(0) = \lim_{z\to 0} f(z) = 1$ makes f analytic.

(b)
$$f(z) = \frac{\cos z}{z}$$

Proof. Since the power series expansion of $\cos z$ is $1 - \frac{z^2}{2!} + \frac{z^4}{4!} - \cdots$,

$$f(z) = \frac{1}{z} - \frac{z}{2!} + \frac{z^3}{4!} - \cdots,$$

and so the singluar part of f is $\frac{1}{z}$.

(j)
$$f(z) = z^n \sin\left(\frac{1}{z}\right)$$

Proof. Note that the Laurent expansion

$$f(z) = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} z^{n-k} = \sum_{k=-\infty}^{n} \frac{(-1)^{n-k}}{[2(n-k)+1]!} z^k$$

has infinitely many terms with negative powers of z and so f has an essential singularity at z=0.

Let $f(z) = \frac{1}{z(z-1)(z-2)}$; give the Laurent Expansion of f(z) in each of the following annuli:

(b) ann(0; 1, 2)

Proof. By partial fractions decomposition,

$$f(z) = \frac{1}{z(z-1)(z-2)} = \frac{1}{2z} - \frac{1}{z-1} + \frac{1}{2(z-2)}.$$

Since |z| > 1,

$$\frac{1}{z-1} = \frac{1}{z} \cdot \frac{1}{1 - \frac{1}{z}} = \frac{1}{z} \sum_{n=0}^{\infty} \frac{1}{z^n} = \sum_{n=1}^{\infty} \frac{1}{z^n}.$$

Since 0 < |z| < 2,

$$\frac{1}{z-2} = -\frac{1}{2} \cdot \frac{1}{1-\frac{z}{2}} = -\sum_{n=0}^{\infty} \frac{z^n}{2^{n+1}}.$$

Hence, the Laurent expansion of f in ann(0; 1, 2) is

$$f(z) = \frac{1/2}{z} - \sum_{n=1}^{\infty} \frac{1}{z^n} - \sum_{n=0}^{\infty} \frac{1}{2^{n+2}} z^n.$$

(c) $\operatorname{ann}(0; 2, \infty)$

Proof. By partial fractions decomposition,

$$f(z) = \frac{1}{z(z-1)(z-2)} = \frac{1}{2z} - \frac{1}{z-1} + \frac{1}{2(z-2)}.$$

Since |z| > 2,

$$\frac{1}{z-1} = \frac{1}{z} \cdot \frac{1}{1 - \frac{1}{z}} = \frac{1}{z} \sum_{n=0}^{\infty} \frac{1}{z^n} = \sum_{n=1}^{\infty} \frac{1}{z^n}.$$

and

$$\frac{1}{z-2} = \frac{1}{z} \cdot \frac{1}{1-\frac{2}{z}} = \sum_{n=1}^{\infty} \frac{2^{n-1}}{z^n}.$$

Hence, the Laurent expansion of f in ann(0; 1, 2) is

$$f(z) = \frac{1/2}{z} - \sum_{n=1}^{\infty} \frac{1}{z^n} + \sum_{n=1}^{\infty} \frac{2^{n-2}}{z^n} = \frac{1/2}{z} + \sum_{n=1}^{\infty} \frac{2^{n-2} - 1}{z^n}.$$

If $f: G \to \mathbb{C}$ is analytic except for poles, show that the poles of f cannot have a limit point in G.

Proof. Suppose $a \in G$ is a limit point of poles of f. Then a cannot be a pole, as there does not exist R > 0 such that $B_R(a) \setminus \{a\}$ is analytic. By the Open Mapping Theorem, there exists r > 0 such that $B_r(f(a)) \subseteq f(G \setminus \{poles\})$. Since f is continuous, $f^{-1}(B_r(f(a)))$ is open in $G \setminus \{poles\}$ and contains a. But then a is a limit point of poles, so there does not exist an open neighborhood of a that is contained in $G \setminus \{poles\}$, contradiction.

Suppose that f has an essential singularity at z=a. Prove the following strengthened version of the Casorati-Weierstrass Theorem. If $c \in \mathbb{C}$ and $\epsilon > 0$ are given, then for each $\delta > 0$ there is a number α , $|c-\alpha| < \epsilon$, such that $f(z) = \alpha$ has infinitely many solutions in $B(a; \delta)$.

Proof. We may assume that a=0, otherwise we work with f(z-a) instead. For $n\in\mathbb{N}$, let $S_n=f[\operatorname{ann}(0,0,\delta/(n+1))]$, the image of f(z) for all $0<|z|<\delta/(n+1)$. Let $\alpha_1=c$ and $r_1=\epsilon$. For $n\in\mathbb{N}$, since S_n is dense by the Casorati-Weierstrass Theorem, there exists $\alpha_{n+1}\in S_n\cap B_{r_n}(\alpha_n)$. By the Open Mapping Theorem, S_n is open, so there exists $r_{n+1}\in(0,\epsilon/(n+1e))$ such that $\overline{B}_{r_{n+1}}(\alpha_{n+1})\subseteq S_n\cap B_{r_n}(\alpha_n)$. By iterating this process, we obtain sequences $\{\alpha_n\}_{n\in\mathbb{N}}$ and $\{r_n\}_{n\in\mathbb{N}}$. Since $r_n\to 0$, α_n is Cauchy and thus converges to some $\alpha\in B_\epsilon(c)\cap\bigcap_{n=1}^\infty S_n$, and the result follows.

Let R > 0 and $G = \{z : |z| > R\}$; a function $f : G \to \mathbb{C}$ has a removable singularity, a pole, or an essential singularity at infinity if $f(z^{-1})$ has, respectively, a removable singularity, a pole, or an essential singularity at z = 0. If f has a pole at ∞ , then the order of the pole is the order of the pole of $f(z^{-1})$ at z = 0.

(a) Prove that an entire function has a removable singularity at infinity iff it is a constant.

Proof. If an entire function f has a removable singularity at ∞ , then $f(z^{-1})$ has a removable singularity at z = 0. But then $f(z^{-1})$ is bounded around 0, which implies f is bounded in any neighborhood of ∞ . By Liouville's Theorem, f is constant.

If f(z) = c, then $f(z^{-1}) = c$ and so f has a removable singularity at ∞ .

(b) Prove that an entire function has a pole at infinity of order m iff it is a polynomial of degree m.

Proof. If an entire function f has a pole at ∞ of order m, then $f(z^{-1})z^m$ has a removable singularity at z=0. But then $f(z^{-1})z^m$ is bounded in any neighborhood of 0, so $f(z^{-1})z^m$, which implies $f(z)z^{-m}$ is bounded in any neighborhood of ∞ . By Liouville's Theorem, $f(z)z^{-m}$ is constant, and thus f(z) is a polynomial of degree m.

If $f(z) = a_m z^m + \dots + a_0$ with $a_m \neq 0$, then $z^m f(z^{-1}) = \lim_{z \to 0} z^m f(z^{-1}) = a_0 z^m + \dots + a_m$, which has a removable singularity at z = 0. Thus, f has a pole at ∞ of order m.

Calculate the following integrals:

(a)
$$\int_0^\infty \frac{x^2 dx}{x^4 + x^2 + 1}$$

Proof. Put $f(z) = \frac{z^2}{z^4 + z^2 + 1}$. Since f is even, $\int_0^\infty f(x) \, dx = \frac{1}{2} \int_{-\infty}^\infty f(x) \, dx$. Note that f has poles at $a_1 = e^{i\pi/3}$ and $a_2 = e^{2i\pi/3}$. For R > 1, let $\gamma_R = Re^{it}$, $0 \le t \le \pi$. Since a_1, a_2 are enclosed by $\gamma_R \cup [-R, R]$, by the Residue Theorem,

$$\int_{-R}^{R} f(x) dx = 2\pi i [\text{Res}(f, a_1) + \text{Res}(f, a_2)] - \int_{\gamma_R} f(z) dz.$$

Calculating the residues, we have

$$\operatorname{Res}(f, a_1) = \frac{e^{2i\pi/3}}{4e^{i\pi} + 2e^{i\pi/3}} = \frac{-\frac{1}{2} + \frac{i\sqrt{3}}{2}}{-4 + 1 + i\sqrt{3}} = \frac{1}{4} - \frac{\sqrt{3}}{12}i,$$

$$\operatorname{Res}(f, a_2) = \frac{e^{4i\pi/3}}{4e^{2i\pi} + 2e^{2i\pi/3}} = \frac{-\frac{1}{2} - \frac{i\sqrt{3}}{2}}{4 - 1 + i\sqrt{3}} = -\frac{1}{4} - \frac{\sqrt{3}}{12}i.$$

As $R \to \infty$,

$$\left| \int_{\gamma_R} f(z) \, dz \right| \leq \int_{\gamma_R} \frac{|z|^2|}{|z^4 + z^2 + 1|} \, |dz| \leq \int_{\gamma_R} \frac{|z|^2}{|z|^4 - |z|^2 - 1} \, |dz| = \frac{\pi R^3}{R^4 - R^2 - 1} \to 0.$$

Hence, combining the above results,

$$\int_0^\infty \frac{x^2 dx}{x^4 + x^2 + 1} = \frac{1}{2} \lim_{R \to \infty} \int_{-R}^R f(x) dx = \pi i \left(\frac{1}{4} - \frac{\sqrt{3}}{12} i - \frac{1}{4} - \frac{\sqrt{3}}{12} i \right) = \frac{\pi}{2\sqrt{3}}.$$

(b) $\int_0^\infty \frac{\cos x - 1}{x^2} \, dx$

Proof. Put $f(z) = \frac{e^{iz}-1}{z^2}$. Let R > r > 0 and define $\gamma_r(t) = re^{-it}$, $0 \le t \le \pi$, and $\gamma_R(t) = Re^{it}$, $0 \le t \le \pi$. Let $\gamma = [-R, -r] \cup \gamma_r \cup [r, R] \cup \gamma_R$. Since f is analytic on $\mathbb{C}\setminus\{0\}$,

$$\int_{\gamma} f(z) \, dz = \int_{-R}^{-r} f(z) \, dz + \int_{\gamma_r} f(z) \, dz + \int_{r}^{R} f(z) \, dz + \int_{\gamma_R} f(z) \, dz = 0$$

Note that

$$\int_{-R}^{-r} \frac{e^{iz} - 1}{z^2} \, dz = \int_{r}^{R} \frac{e^{-iz} - 1}{z^2} \, dz,$$

and so

$$\int_{-R}^{-r} f(z) dz + \int_{r}^{R} f(z) dz = \int_{r}^{R} \frac{e^{iz} + e^{-iz} - 2}{z^{2}} dz = 2 \int_{r}^{R} \frac{\cos(z) - 1}{z^{2}} dz.$$

Hence,

$$\int_{r}^{R} \frac{\cos(z) - 1}{z^{2}} dz = -\frac{1}{2} \int_{\gamma_{R}} f(z) dz - \frac{1}{2} \int_{\gamma_{R}} f(z) dz.$$

As $R \to \infty$,

$$\left|\int_{\gamma_R} f(z)\,dz\right| \leq \int_{\gamma_R} \frac{|e^{iz}-1|}{|z|^2}\,|dz| \leq \frac{1}{R^2} \left(\int_{\gamma_R} |e^{iz}|\,|dz| + \int_{\gamma_R} |dz|\right) = \frac{2}{R^2} \int_{\gamma_R} |dz| = \frac{2\pi}{R} \to 0.$$

On the other hand, since $f(z) = \frac{i}{z} - \frac{1}{2} - \frac{iz}{6} + \cdots$,

$$\lim_{r \to 0} \int_{\gamma_r} f(z) dz = \lim_{r \to 0} i \int_{\gamma_r} \frac{1}{z} dz + \left(-\lim_{r \to 0} \int_{\gamma_r} \frac{1}{2} dz + \lim_{r \to 0} \int_{\gamma_r} \frac{iz}{6} dz - \cdots \right)$$

$$= \lim_{r \to 0} i \int_{\gamma_r} \frac{1}{z} dz$$

$$= \lim_{r \to 0} i \int_0^{\pi} \frac{-ire^{-it}}{re^{-it}} dt = \pi.$$

Thus,

$$\int_0^\infty \frac{\cos(z) - 1}{z^2} \, dz = -\frac{1}{2} \lim_{r \to 0} \int_{\gamma_r} f(z) \, dz = -\frac{\pi}{2}.$$

Problem 7

Verify the following equation:

$$\int_0^{\pi/2} \frac{d\theta}{a + \sin^2 \theta} = \frac{\pi}{2\sqrt{a(a+1)}}, \quad \text{if } a > 0;$$

Proof. Note that

$$\int_0^{\pi/2} \frac{d\theta}{a + \sin^2 \theta} = \int_0^{\pi} \frac{1}{2a + 1 - \cos \theta} d\theta,$$

and since $\cos \theta = \cos -\theta$,

$$\int_0^{\pi} \frac{1}{2a + 1 - \cos \theta} \, d\theta = \frac{1}{2} \int_0^{2\pi} \frac{1}{2a + 1 - \cos \theta} \, d\theta.$$

Put $z = e^{i\theta}$ and we have

$$\int_0^{2\pi} \frac{1}{2a+1-\cos\theta} \, d\theta = \int_{|z|=1} \frac{1}{2a+1-\frac{z+z^{-1}}{2}} \, \frac{dz}{iz} = 2i \int_{|z|=1} \frac{1}{z^2-(4a+2)z+1} \, dz.$$

Let $f(z) = \frac{1}{z^2 - (4a+2)z+1}$. f(z) have simple poles at $z = 2a+1\pm 2\sqrt{a(a+1)}$. Since $|2a+1+2\sqrt{a(a+1)}| > 1$, by the Residue Theorem,

$$\int_{|z|=1} \frac{1}{z^2 - (4a+2)z + 1} dz = 2\pi i \operatorname{Res}(f, 2a+1 - 2\sqrt{a(a+1)}).$$

Since

$$\operatorname{Res}(f, 2a+1-2\sqrt{a(a+1)}) = \left. \frac{1}{2z - (4a+2)} \right|_{z=2a+1-2\sqrt{a(a+1)}} = -\frac{1}{4\sqrt{a(a+1)}},$$

we have

$$\int_0^{\pi} \frac{1}{2a+1-\cos\theta} \, d\theta = \frac{1}{2} \cdot 2i \cdot 2\pi i \cdot -\frac{1}{4\sqrt{a(a+1)}} = \frac{\pi}{2\sqrt{a(a+1)}},$$

for a > 0.

Suppose that f has a simple pole at z = a and let g be analytic in an open set containing a. Show that

$$\operatorname{Res}(fg; a) = g(a) \operatorname{Res}(f; a).$$

Proof.

$$\operatorname{Res}(fg;a) = \lim_{z \to a} (z-a) f(z) g(z) = g(a) \lim_{z \to a} (z-a) f(z) = g(a) \operatorname{Res}(f;a).$$

Use the previous result to show that if G is a region and f is analytic in G except for simple poles at a_1, \ldots, a_n ; and if g is analytic in G, then

$$\frac{1}{2\pi i} \int_{\gamma} fg = \sum_{k=1}^{n} n(\gamma; a_k) g(a_k) \operatorname{Res}(f; a_k)$$

for any closed rectifiable curve γ not passing through a_1, \ldots, a_n such that $\gamma \approx 0$ in G.

Proof. By the Residue Theorem and the last problem,

$$\frac{1}{2\pi i} \int_{\gamma} fg = \sum_{k=1}^{n} n(\gamma; a_k) \operatorname{Res}(fg; a_k) = \sum_{k=1}^{n} n(\gamma; a_k) g(a_k) \operatorname{Res}(f; a_k).$$
